

OPERATOR PACKET FOR KEYMON PENN

YOUR NEW BUILD OPERATING SYSTEM

RECEIPT TIME: 2026-07-07 14:41 PDT · VOICE: RORYWORDS · TRUTH: RECEIPT-GATED

KP, the simple version is this: we moved you from scattered tool memory into a bridge-backed operating system. Claudex is the control plane. Obsidian is the human-readable brain. GitHub is the durable transport. ByRedLLC OS is the operating dashboard. Codex and Claude stop guessing and start reading the same receipts.

THE REAL SHIFT

You do not need to remember where every decision, build packet, receipt, or blocker lives. You need to start from the bridge, name the outcome, name the proof, and let the system route the work.

BUILT

/claudex capture lane

A trigger for turning chat context into a Claudex artifact and Obsidian-ready note.

BUILT

Heartbeat schedule

Hourly heartbeat, five-minute local watcher, fifteen-minute GitHub alignment signal.

BUILT

Bridge discipline

SYNC GREEN/YELLOW/RED tells you whether to move, handle warning, or stop.

PROMOTED

Receipts over memory

A claim becomes reusable only when it has a file, commit, command, URL, or read-back proof.

WHAT CHANGED MENTALLY AND MANUALLY

STOP CARRYING THE WHOLE SYSTEM IN YOUR HEAD

OLD PATTERN

- Notion or Monday holds pieces of truth, but the agent still needs a long recap.
- Chat context disappears unless someone manually copies it.
- Agents say work is complete before the receipt proves it.
- Rory and KP each have partial context and have to re-explain the work.
- Project tracking is a dashboard habit instead of an operating system.

NEW PATTERN

- Claudex is the narrow control plane. It does not become a junk drawer.
- Obsidian is the human-readable view. It mirrors useful notes, not raw secrets.
- GitHub carries bridge state, receipts, questions, directives, and history.
- ByRedLLC OS becomes the internal dashboard KP can use like Monday/Notion, but backed by receipts.
- Every session starts with outcome and ends with proof.

SYSTEMS PROMOTED AND DROPPED

SURFACE	STATUS NOW	PLAIN MEANING
Claudex	Promoted	Shared brain for Claude, Codex, Rory, KP, bridge state, receipts, directives, questions.
GitHub	Promoted	Durable transport. If it is committed, both sides can see it.
Obsidian	Promoted as view	Human brain room. Great for reading, linking, and daily operating memory.
ByRedLLC OS	Promoted	Internal operating dashboard at byredlanternos.com. Use it like your command room, not a note pile.
Notion / Monday	Demoted as defaults	Useful for legacy or client surfaces, but not the canonical operating truth unless a lane says so.
Chat memory	Demoted	Useful for conversation. Not proof. `/claudex` turns valuable chat into durable context.

DAY 1 OPERATING GUIDE

HOW KP USES THIS TOMORROW

1. START WORK**Name the outcome**

Say: "Outcome: Amina build 6 ready for TestFlight. DONE = archive receipt + TestFlight proof. NOT NOW = redesign."

2. SAVE CONTEXT**Use /claudex**

Say: `/claudex save this decision and next step`. The agent classifies it, writes the right Claudex artifact, and prepares the Obsidian mirror.

3. WATCH SYNC**Trust the color**

GREEN means move. YELLOW means handle warning. RED means stop and resolve the blocker.

4. ASK ACROSS ENGINES**Use questions**

If Rory's side needs your machine, it can ask through `OPS/questions/`. Your engines answer when they run.

5. KEEP RECEIPTS**No proof, no claim**

A build, send, upload, fix, or deploy is not complete until the artifact proves it.

6. READ THE OS**Use byredlanternos.com**

Use the internal OS like a smarter Monday/Notion: project state, receipts, agent outputs, and dashboard views.

THE NEW HABITS

INSTEAD OF	DO THIS
"Continue where we left off."	Let `pe continue` and Claudex bridge tell the agent the lane, receipt, and next step.
"Remember this."	`/claudex` it, so future agents read a file instead of guessing.
"Is it done?"	Ask: "What receipt proves it?"
"Where is that thing?"	Ask from the bridge: receipt, directive, question, architecture, CTP, or status.

KP BRIDGED WITH RORY

HOW WE WORK WITHOUT RE-EXPLAINING

The bridge means your Codex, your Claude, Rory's Claude, and the product repos can share state without pretending they are one live mind. They are separate engines reading the same durable source.

HEARTBEAT

Hourly

Recomputes bridge state, sweeps questions/directives, and writes digest output only with evidence.

LOCAL WATCHER

Every 5 minutes

Fetches remote state and applies safe receipt-backed updates.

GITHUB SIGNAL

Every 15 minutes

Runs alignment checks and publishes a durable signal.

QUESTION DESK

Async

Rory can ask Keymon's engine a question. Keymon's engine answers from his machine/repo proof.

HOW TO LEAN ON RORY AS SENIOR PM / ARCHITECT

Use Rory upstream, before the build gets expensive. The strongest move is not asking Rory to clean up after a build. It is asking him to lock the product architecture before Codex spends cycles.

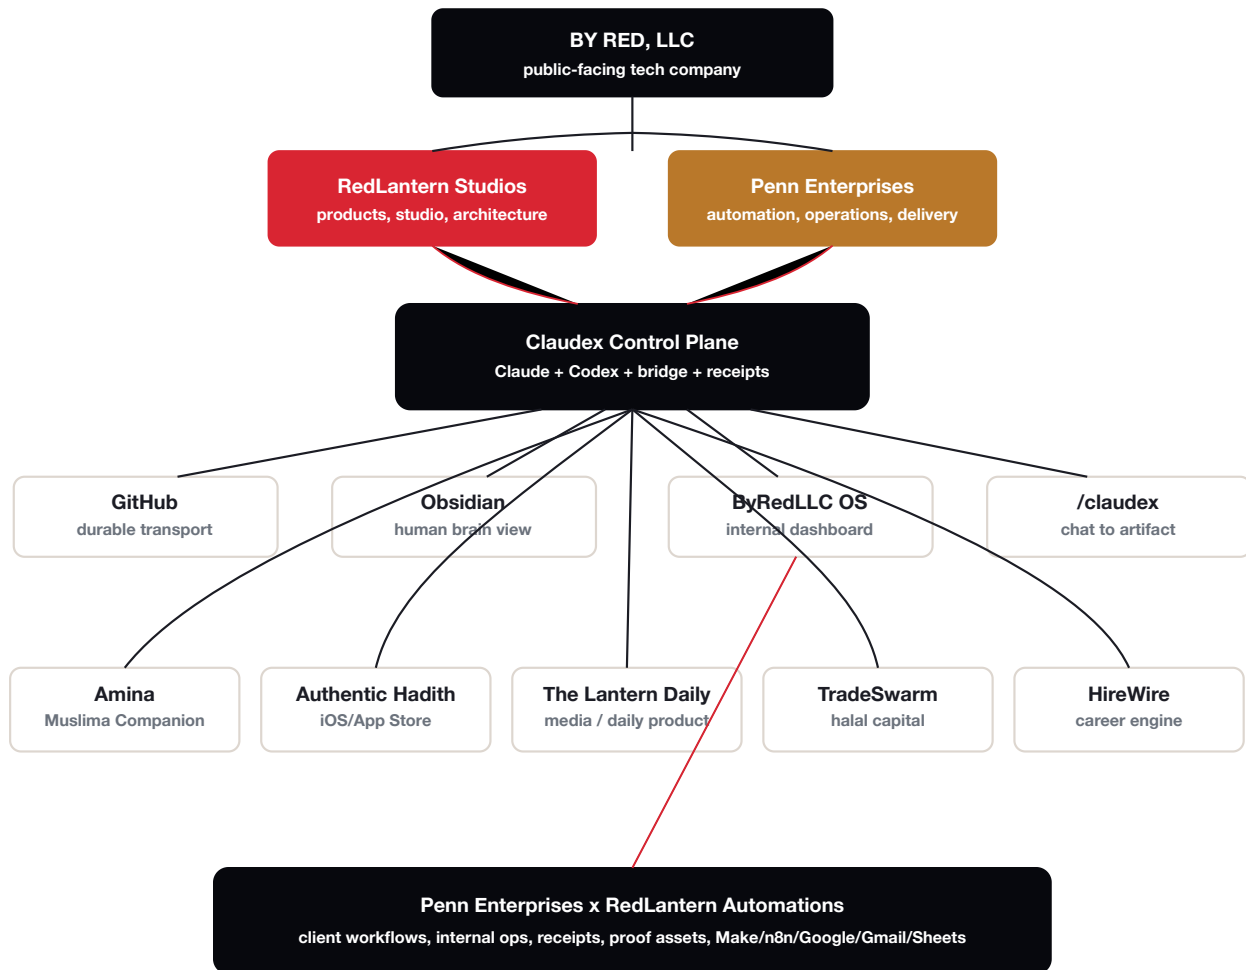

ASK RORY FOR	WHEN	WHAT KP GIVES HIM
Scope lock	Before a fuzzy build	Outcome, DONE receipt, NOT NOW boundary.
Senior product review	Before user-facing changes	The screen/flow, user promise, risk if wrong.
Architecture call	Before new systems/integrations	Producers, consumers, data owner, recovery path.
Business positioning	Before public claims/decks	Audience, proof level, what cannot be overclaimed.

RORYWORDS

Bring me the outcome, the proof that ends it, and what we are not doing. I can help you avoid building the wrong machine beautifully.

ARCHITECTURE MAP

BY RED SYSTEM FLOW

CAPABILITIES IN PLAIN ENGLISH

WHAT THIS LETS KP DO IMMEDIATELY

CAPABILITY	WHAT KP SAYS	WHAT HAPPENS
Save a decision	`/claudex save this scope lock`	Creates a durable artifact in Claudex and mirror-ready Obsidian note.
Continue a workflow	`continue`	Agent reads current pointer, bridge, provider router, adapter, and tells KP GREEN/YELLOW/RED.
Ask Rory's side	`ask Rory/Claude...`	Creates a tracked question/directive instead of burying the ask in chat.
Package proof	`make this receipt-backed`	Agent names file paths, commands, URLs, read-backs, and what remains unverified.
Use ByRedLLC OS	`show my dashboard/state`	Use the internal OS as a live command room, like Notion/Monday with receipt discipline.
Get PM architecture	`Rory, scope this before build`	Rory pressure-tests outcome, system architecture, user promise, and proof gate before execution.

DAY 1 CHECKLIST

1. Use `/claudex` for every important decision, build handoff, architecture note, or next-step packet.
2. Stop asking agents to remember. Ask them where the receipt lives.
3. Start each build with: outcome, DONE receipt, NOT NOW boundary.
4. Use Rory for product architecture before the work enters implementation.
5. Use ByRedLLC OS for the command-room view; use Obsidian for reading; use Claudex for truth.

BOTTOM LINE

This is how your work stops depending on heroic memory. The system gives every agent the same map, the same proof standard, and the same place to leave receipts.

RECEIPT NOTES

VERIFIED Claudex local docs and scripts exist for bridge, Obsidian sync, heartbeat, scheduled watcher, GitHub alignment, question exchange, and /claudex protocol.

VERIFIED `byredlanternstudios.com` was checked as a public website and `byredlanternos.com` was checked as an internal OS login surface in this session.

PARTIAL By Red, LLC legal standing, 11-year history, and DUNS claims are Rory-provided context in this packet unless separately verified against official sources.

HANDOFF FOR KEYMON

USE THE SYSTEM LIKE A PARTNER

KP, your new job is not to manually carry the operating system. Your job is to point the system at the right outcome and demand proof.

THE MENTAL MODEL

Claudex is not another app to babysit. It is the shared control layer that keeps agents honest and aligned. Obsidian is where the human-readable brain lands. ByRedLLC OS is where the work can be viewed and operated. GitHub keeps the receipts durable.

Rory is your Senior PM / Architect lane. Lean on him before the build, not after. The leverage is in architecture, sequencing, proof gates, and preventing beautiful wrong builds.

WHAT TO SAY NEXT

COPY PATTERN

Rory, scope this before build. Outcome: [one sentence]. DONE = [receipt]. NOT NOW = [boundary]. Risks I see: [list]. What architecture should Codex execute?

FOR EVERY BUILD

Outcome first

If the win is not one sentence, the build is not ready.

FOR EVERY CLAIM

Receipt first

If the proof is missing, the claim is partial or unknown.

FOR EVERY HANDOFF

/claudex it

Do not let valuable context die in chat.
